

(a)

Nominal periodic ESKF only:  $T=1$  s;  $q=\min(1, 1/ft)$ ;  $q_{\text{other}}=0$ . Continuous-cycle approximation.  
 $H(M) = 24 + 4M$  B;  $N \leq M$ . Current  $M = 4$ ;  $N > 4$  uses  $M = \max(4, N)$  as extrapolation.

(b)

Nominal periodic ESKF only:  $T=1$  s;  $q=\min(1, 1/ft)$ ;  $q_{\text{other}}=0$ . Continuous-cycle approximation.  
 $H(M) = 24 + 4M$  B;  $N \leq M$ . Current  $M = 4$ ;  $N > 4$  uses  $M = \max(4, N)$  as extrapolation.

(c)

Nominal periodic ESKF only:  $T=1$  s;  $q=\min(1, 1/ft)$ ;  $q_{\text{other}}=0$ . Continuous-cycle approximation.  
 Mean SCK budget; no gaps, software or retries. FULL bursts may exceed a round deadline.  $N > 4$ : extrapolation.

(d)

Nominal periodic ESKF only:  $T=1$  s;  $q=\min(1, 1/ft)$ ;  $q_{\text{other}}=0$ . Continuous-cycle approximation.  
 Mean SCK budget; no gaps, software or retries. FULL bursts may exceed a round deadline.  $N > 4$ : extrapolation.
