

Module scaling: observations and conditional projections

Target 200 Hz | observed N = 1-4 | modelled extension to N = 100

— FULL: theoretical model - - DELTA full coverage: projection ■ DELTA zero load observed
- - DELTA zero load: projection ● FULL observed ◆ DELTA full coverage observed

DELTA projections hold the N=4 mean payload constant: 236.47 B/module (zero load), 527.44 B/module (full coverage).

Payload means include periodic syncs; projections assume 200 Hz and unchanged activity per module. Beyond N=4 is unmeasured.

Filled markers: arithmetic means of run rates; open markers: individual runs. All recorded runs, including CHECK REQUIRED, are retained.
