

DELTA frame-length model for 100 modules

Ordinary DELTA frames | K = changed cells per module | decimal kB = 1,000 B

$$L_{\text{DELTA}}(N, K) = 24 + 4\max(4, N) + N(84 + 2K) \quad \text{B}$$

Four module headers are retained for $N \leq 4$; one header per module is assumed for $N > 4$. Same K is assumed in each module.

At $K=480$, DELTA equals FULL; $K>480$ triggers FULL fallback. $N>4$ is an extended logical-round model, not a current MUL1 packet.
