

M1 / FSR1 - calibration-function comparison (gamma=4)

Representative cell R8C8: forward response

R8C8: actual estimation functions

Same RAW endpoints; output range 0-5000 g. Right ADC axis: 0-1387, ending at this cell's measured endpoint at U.
 Multi-point uses a linear inverse LUT, not an exact PCHIP inverse; plateaus and endpoint offsets remain.
 GAMMA is prescribed. Endpoint clamping is retained; separation of these functions is not evidence of accuracy.
